

A Multi Spectrum Disinfectant

BKC PLUS 80%

Description

Benzalkonium chloride is a quaternary ammonium compound, some times referred as quates. These compounds are most commonly used disinfectants in the aquaculture industry. They are cationic surfactants (positively charged surface-active agents) that impact cell walls and membranes after relatively long contact times. Their permanent positive charge makes them bind readily to the negatively charged surface of most microbes. These quaternary ammonium compounds are mostly unaffected by pH levels and remain effective for a long time.

BKC Plus is an 80% quaternary ammonium compound which is a wide spectrum antimicrobial agent effective against both bacteria, viruses and fungi.

Benefits

- ▶ BKC Plus is effective against pathogens such as bacteria, viruses and fungi.
- ▶ BKC Plus helps in regular moulting of shrimps.
- ▶ BKC Plus helps in cleaning the wounds, ulcers in fish culture.
- ▶ BKC Plus keeps the water clean.
- ▶ BKC Plus helps in higher survival and improves profitability.

Composition

- ▶ 80 Alkyldimethylbenzylammonium chloride

Dosage

2 to 5 lts/ acre or as advised by aquaculture consultant.

Application

Dissolve BKC Plus in sufficient good water and apply evenly during sunny time

Presentation

5 Kg Pack
