DACTONIL

Description

Gill flukes can be the most destructive of all parasites known to fresh water fish, which can only be seen under microscope.

They gather in groups at the opening of the gills and feed on the tender tissue. Left unchecked, flukes can cause bacterial gill disease and make it almost impossible for the fish to dissolve oxygen into the blood through the gills. They actually carry harmful bacteria that penetrates into the skin and gills, resulting in formation of ulcer disease.

Head hanging and gasping for air along with flashing may indicate the presence of gill flukes due to depletion of Oxygen for the fish.

Benefits

- ▶ Dactonil kills gill flukes
- ▶ Dactonil prevents secondary infection caused by gill flukes
- ▶ Dactonil prevents formation of ulcers.
- ▶ Dactonil Improves Immunity and growth

Composition

A mixture of active phytochemical compounds with antihelminthic, antiparasitic and antibacterial activity.

Dosage

100 Gms/ton of fish for 6-7 days
If more fish are seen swimming on
the surface of the pond,
mix some quantity of Dactonil with rice
bran and apply it in the pond.

Presentation

1 K g Pack
