Shrimp & Fish Care

FEED
SUPPLEMENT

BIO FEED

Description

BIO-FEED (Natural Feed Enhancer) is a product which contains living microorganisms. BIO-FEED when applied to aquaculture ponds add nutrients through the natural process of Nitrogen fixation, solubilizing Phosphorus and stimulating the phytoplankton growth through the growth promoting substances.

BIO-FEED reduces the use of chemical fertilizers and pesticides. The Microorganisms present in BIO-FEED restore the soil natural nutrient cycle and build soil organic matter. BIO-FEED is extremely advantageous in enriching soil fertility and fulfilling phytoplankton nutrient requirements by supplying the organic nutrients through microorganisms and their bi-products.

BIO-FEED is an eco-friendly organic agro input and more cost effective than in organic fertilizers.

BIO-FEED contains micro organisms such as Rhizobium, Azotobacter, Azospirillum and blue green algae. Blue green algae such as nostoc fix atmospheric nitrogen. Other types of bacteria such as phosphate solubilizing bacteria are able to solubilize the insoluble phosphate from organic and inorganic phosphate.

In addition to Nitrogen fixing and phosphate solubilizing bacteria, sea weed is the major component in bloom rich. Sea weed contains essential Macro and Micro Nutrients such as Calcium, Iron, Magnesium, Manganese, Potassium, Silicon, Zinc, Copper, Cobalt, Boron, Sulphur etc.,)

Benefits

- Bio-Feed maintains stable Phytoplankton and Zooplankton populations
- Bio-Feed reduces the usage of inorganic fertilizers
- Bio-Feed reduces the usage of organic fertilizers such as chicken manure
- Bio-Feed reduces the usage of pesticides
- Bio-Feed increases the pond productivity and lowers the F.C.R.

Dosage

2 kg/Acre once in every month
(or)
Advised by
Aquaculture consultant

Presentation
